Praxair Surface Technologies, Inc. is a world leader in thermal spray equipment and materials and in coatings technology. Our focus is on providing the right coatings solution for any application. As a primary contributor to the development and commercialization of the arc spray process, Praxair continues to lead in advancing the technology. Arc spray is at the core of what we do everyday, and we provide a complete family of products that reflects years of application knowledge with our history of equipment engineering and coatings expertise.

As with any process, the selection of arc spray equipment is only the first step. At Praxair we believe that the development of arc spray wires, in addition to focusing on application technology, pushes the thermal spray process toward expansion into new areas of surface-enhancement solutions. We have dedicated teams of engineers to work with you to develop solutions that expand the market for cost-effective thermal spray applications. Let us work with you to select the best arc spray system and then help you maximize your output and returns.

For more information, please contact your local representative or contact our U.S. headquarters:

The arc spray process is used in multiple industries for many demanding applications including some in the aerospace industry.
A long history of proven success

The arc spray process is at the very core of Praxair Surface Technologies' broad line of thermal spray equipment. This is because of Praxair’s historic development and pioneering of applications focused on the arc spray process and our commitment to equipment design and commercialization. We provide a complete family of arc spray products, each using tailored technologies for various coating solutions. The range stretches from “push” to “pull” to “push/pull” wire-feed technologies and to innovative process enhancements like Internal Diameter (ID) spray extension and the ArcJet™ spray attachment. In addition, we offer a variety of configurations that will support the most demanding applications.

**Arc spray models**

**8830**
A true classic of the arc spray line which features an air-driven “pull” 350-amp gun and a control that is simple to operate, the 8830 has become a proven economical and reliable standard of excellence with thousands of applications worldwide.

**8835**
Adaptable to any spray environment, the 8835 features an electric motor “pull” 350-amp gun and modular unbundled control technology. The PLC controls can be used in either automatic or manual mode, and the gun is flexible enough to be handheld or robotically mounted.

**BP-400**
A versatile robust option, the BP-400 features a lightweight point-and-shoot gun utilizing “push” wire feed technology. Designed with a 350-amp output, the system provides both application and production flexibility with superior coating results.

**CoArc™ system**
A combination of the best-of-all-worlds in TAFRA products, the CoArc system features the 9935 350-amp gun combining the robust 8835-type drive with high air flow capability and a “pull” or “push/pull” wire delivery system. Designed with a variety of “state-of-the-art” features and options, it revolutionizes arc spraying by close-looping the spray process.

The 9935 is a robust, machine mounted or hand-held gun combining the proven, rugged wire drive of the 8835, with a reliable DC servo motor, the high volume air flow capability of the 9000 with a new improved nozzle design to truly make the 9935 the state-of-the-art arc spray gun.
Praxair has modeled equipment strategies around reliability and versatility in use, operation and application. The arc spray process itself provides the best combination of reliability and versatility of all thermal spray processes, and the 8830 and 8835 have a reputation for great performance and reliable operation in thousands of applications through the years. The guns are designed to perform with minimum operator adjustment, assuring quality coatings time and time again. Process set-up includes only loading wire, setting the voltage, and pushing the “On” button. No other adjustments are needed.

The 8835 offers the same properties as the 8830, but also includes the versatility of modular design. It can be unbundled – the console and the wire feed cart can be separated from the power supply to add more range of use. The 8835’s PLC controls are designed for hand or robotic operation and provide consistently repeatable coatings through a multitude of application and control options.

**8830 and 8835 features**

- “Pull” wire feed design utilizing either an air drive (8830) or electric drive (8835) with:
  - Optimum energy transfer tip/tube assembly
  - Error-proof alignment housing
  - Permanent arc shield protection
- Double yoke wire feed unit
- 350-amp 100% duty cycle power supply

Our engineering team integrates thermal spray automation, such as this robot-mounted multiple gun arc spray configuration developed for a large automotive OEM.
Dependable and consistent

Designed with reliability, robustness and flexibility in mind, the BP-400 can handle a variety of applications without compromising coating quality. Lightweight, portable and easy to use, the BP-400 offers one-touch, point-and-shoot operation. Based on a highly engineered "push" wire delivery system, the BP-400 virtually eliminates drive mechanism maintenance. This leads to lightweight gun design, fewer worries, and reliable operation.

**BP-400 features**
- "Push" wire feed design
- Lightweight gun with no moving parts
- Synchronous dual wire feeding
- 350-amp 100% duty cycle power supply
- Handheld or machine mounted

Offering all the benefits of the other arc spray models plus much more, the 9935 gun when used with the CoArc™ system provide modularity, and robustness. Advanced controls make the CoArc system the ultimate in flexibility and ease-of-use. The CoArc system has the option of supplying the wire with "push/pull" technology and when combined with the optional closed-loop control of gun head's voltage and air pressure, truly revolutionizing the arc spray process to ensure consistent, reproducible coating quality.

**CoArc system features**
- Touch-screen operator interface
- Monitoring of spray head voltage and air pressure
- Recipe storage
- Simple, modular design
- Advanced power supply

Simple to operate yet robust, the BP-400 arc spray system produces high-quality metallic coatings.
Arc spray solutions for excellent coatings

8830

A proven, reliable and economical arc spray classic

Features:
- “Pull” wire feed design
- Air motor driven
- 1.6mm or 2mm wire feed capability
- Robust construction
- Rated for operation up to 350 amps
- Designed for handheld operations

8830 system components and options
- 350-amp power supply
- 8830 control console
- 8830 gun
- Optional ArcJet™ attachment
- Optional anti-skid retrofit kit
- Optional ID extension for straight-ahead or angled spray

8835

An easy-to-operate, robust arc spray system designed for maximum application flexibility

Features:
- “Pull” wire feed design
- Electric motor driven
- 1.6mm or 2mm wire feed capability
- PLC controlled
- Built-in e-stop interface
- Rated for operation up to 350 amps
- Designed for automated operations
- CE, UL and 3C certified

8835 system components and options
- 350-amp power supply
- 8835 control console
- 8835 gun
- Built with ArcJet™ attachment
- Modular, unbundled construction
- Optional anti-skid retrofit kit
- Optional fan spray air cap
- Optional ID extension for straight-ahead or angled spray
- Optional robot gun mount
BP-400

Simple, lightweight, and durable arc spray system with a proven track record

Features:
“Push” wire feed design
1.6mm, 2mm and 1/8-inch wire feed capability
Rated for operation up to 350 amps
Simple construction
Designed for handheld or machine-mounted operation
CE certified

BP-400 system components and options
350-amp power supply
BP-400 control console
BP-400 gun
Optional high-velocity conversion kit
Optional fan spray conversion kit
Optional 2.3mm conversion kit
Optional ID extension for straight-ahead or angled spray
Optional robot gun mount

CoArc™

High-tech, modular arc spray system with advanced control features for reproducible and exceptional coating quality

Features:
“Pull” wire feed design
1.6 mm and 2mm wire feed capability
PLC controlled
Rated for operation up to 350 amps
“Touch-screen” operator interface
Spray head monitoring of voltage and air pressure
CE, UL, and 3C certified

CoArc system components and options
350-amp enhanced power supply
CoArc control console
9935 gun
Recipe storage
Maintenance scheduling
Optional “push/pull” wire feed
Optional closed-loop control of head voltage and pressure
Optional wire counter/“out” indicator
Optional Data acquisition capability
Optional remote OIT/unbundled capability
Optional 8830 capability

BP-400 system
CoArc system
Proud of our role in the emergence and growth of the arc spray process, we continue to develop and refine not only equipment and consumables but also arc spray applications. Arc spray coatings are becoming more and more accepted in applications around the world due to the quality, low cost, ease of use, and repeatability of the process.

Praxair has worked closely with industry to develop arc spray solutions for some of the most demanding coating applications. While most arc spray coatings still utilize metallic alloy compositions, the advent and growth of engineered, composite cored wires broadens the use of arc spray technology. For coatings ranging from simple dimensional restoration, to engineered solutions for complex surface treatment requirements, arc spray provides competitive, high quality answers to problems.

**Aircraft component repair**
Most major aircraft engine manufacturers specify the use of the arc spray process for repairs of many aircraft engine components. Coatings are applied to various components for dimensional restoration, hot temperature erosion resistance, and as bond coats.

**Wear resistance**
Cored wire technology has broadened the spectrum of arc spray applications. With a tailored chemistry of cored wires, including carbide-bearing compositions, it is possible to produce coatings with excellent sliding wear resistance as well as abrasion resistance.

**Corrosion protection**
Arc sprayed coatings are used widely to fight both high and low temperature corrosion. These coatings have proven their excellence in challenging environments such as boilers, by providing oxidation and heat resistance. Arc sprayed coatings also provide excellent resistance to atmospheric corrosion and are used on bridges and other infrastructural components.
Part restoration

The forgiving nature and flexibility of the arc spray process enables economical application of thick coatings without significant loss of bond strength. For this reason, arc spray has become the process of choice for part restoration in applications where the replacement costs are high or the part has to be refurbished on-site.

Electrical conductivity and resistivity

Arc sprayed aluminum, tin, zinc and other materials are used in applications requiring good electrical conductivity. Aluminum coating on metal oxide varistors, for example, creates an electrical conductivity contact surface on the face of the varistor.

Mold making

The mold-making industry uses arc spray to produce thick coatings during the mold process. The coating characteristics help improve yields from the molds, and the efficiency of the process has also helped in rapid tool prototyping technology.

Automotive

The arc spray process is used in the automotive industry for coatings that provide corrosion protection, body repairs, and weld-seam filling.
Praxair is committed to the development and advancement of arc spray equipment and applications. The innovation of technology such as the ArcJet™ attachment and ID extensions has continued to drive the process forward.

The ArcJet attachment is a revolutionary, patented technology that has allowed the arc spray process to rival the coating quality of higher-end processes like plasma spray. The ArcJet attachment increases particle velocities and concentrates the spray pattern to produce dramatically improved coating quality. Coatings are similar to plasma-sprayed coatings; however, with the ArcJet attachment, these plasma-like coatings can be produced in much less time and at a fraction of the cost.

Other advantages that the ArcJet attachment has over conventional arc spray configurations include:
- Higher deposition efficiency
- Higher particle velocities
- Denser coating
- Focused, narrow spray pattern
- Superior bond strength
- Smoother as-sprayed coating
- More uniform microstructure

For years, the arc spray process has been limited in its ability to reach internal diameters. The development of ID arc spray extensions has been a major leap in improving process technology. Optional ID extensions, which are easily adapted to existing guns, are available in both straight-ahead and angle configurations and come in a variety of lengths. In addition, highly engineered nozzles, tips and positioners have been designed for applications that demand maximum durability.

Since the inception of arc spraying, power supplies used with the arc spray equipment have been standard off-the-shelf or slightly modified welding power supplies. Praxair has developed a power supply which minimizes the operating arc voltage. Lower operating voltage reduces the oxide levels within the coatings (improved particle size distribution) and increases deposit efficiency significantly depending on the material being sprayed. Importantly, the enhanced 353ECV power supply provides improved performance at lower voltages than conventional power supplies by providing a more stable arc output. These benefits offer the user maximum process reliability and flexibility, including a wider spray range.
Exceptional wires for superior coatings

Whether your application calls for a reliable bond coat, dimensional restoration, or resistance to wear and corrosion, Praxair has a wire to meet the challenge. All Praxair wires are engineered and manufactured exclusively for the specialized needs of thermal spray. Strict specifications and production controls are utilized so that each wire is manufactured to a precise metallurgical composition and is free from defects such as slivers or contaminants. Care is also taken to ensure that our wires have the proper physical properties for thermal spraying – tensile strength, hardness and surface finish – and that they are properly spooled for reliable performance.

When you search for the right thermal spray wire, remember the company that built its reputation on arc spray technology: Praxair Surface Technologies. Let us work with you to continue to develop and perfect quality arc spray wires and coatings.

Quality thermal spray wires must be made to tight compositional tolerances, have the appropriate surface finish, and be spooled properly for consistent performance.
